1. Communication frame in RTU mode (Remote Terminal Unit)

A MODBUS frame is composed of:

T1 T2 T3	Address (8 bit)	Function (8 bit)	Data (N x 8 bit)	CRC (16 bit)	T1 T2 T3
----------	--------------------	---------------------	---------------------	-----------------	----------

in which:

- the Address field contains the address of the Slave to which the message is sent
- the Function field contains the code of the function that must be carried out by the Slave
- the Data field contains the information needed by the Slave to carry out a specific function or contains data collected from the Slave in response to a question
- the CRC field allows both the Master and the Slave to check a message in order to detect any errors in transmission. Sometimes, due to electrical “noise” or other interference, a message may be changed during the transmission from one unit to another. The error check ensures that neither the Master nor the Slave react to messages that have been haltered
- the T1 T2 T3 sequence represents the time that separates one frame from another, and corresponds to at least 3 and a half characters: during this period no one is allowed to talk on the bus, to let the instruments detect that a frame is over and another one is starting

In RTU mode, the synchronisation of the frame can be maintained only by simulating a synchronous message. The receiving device, a R5 for example, measures the time that separates the reception of one character and the reception of the subsequent one (for example, between address and function). If this time is longer than the time needed to transmit three and a half characters, then the message is considered lost and the next character arriving is considered to be an address, in other words the beginning of a new frame.

2. Activation of Modbus protocol and available functions

For R8 and R14 models is necessary enter the setup menu and set “Prot MODBUS” in the “Protocol” page of the Communication’s menu. For R5 it is necessary enter the setup and set “Prt” = “Mod”.

The available MODBUS functions are reported in the following table:

Modbus functions	Action performed in the PFC
------------------	-----------------------------

01 = READ OUTPUT STATUS	Read data relative to the output status
03 = READ HOLDING REGISTERS	Reads data relative to the Measurements and the Setup
06 = PRESET SINGLE REGISTER	Sets Setup parameters
16 = PRESET MULTIPLE REGISTER	Sets Setup parameters
17 = REPORT SLAVE I.D.	Reads the identification of the instrument type

IMPORTANT NOTE REGARDING FUNCTIONS 3 AND 6 DESCRIBED BELOW:

Whenever the user employs commercial programs for reading the data from the Slaves, and these programs are already designed for handling the MODBUS protocol, it is necessary to use the addresses of the storage locations indicated in the first left-hand column of the tables relative to functions 3 and 6 illustrated below.

Instead, whenever the user writes his own program to read the data it is necessary to decrease by one the addresses reported.

For example: the Master wishes to read from slave with address 3 the value of the three-phase equivalent current, available at memory address 18 (= 12Hex).

The communication frame of the Master to the Slave, with hexadecimal values, will be the following:

03	03	00	11	00	02	95	EC
----	----	----	----	----	----	----	----

ove:

- 03 = PFC address (Slave) n° 03
- 03 = function requested by the Master, in this case measure reading request
- 00 11 = address, reduced by one unit (12H - 1H = 11H), of the storage location to be read and containing the value of the three-phase equivalent current
- 00 02 = number of registers to be read beginning with address 11H
- 95 EC = CRC

The Slave response frame to the Master in hexadecimal values will be the following:

03	03	04	00	00	01	E0	D9	EB
----	----	----	----	----	----	----	----	----

in which:

- 03 = PFC address (Slave) no. 03
- 03 = function requested by the Master, in this case measure reading request
- 04 = number of data bytes following in the frame
- 00 00 01 E0 = hex value of the three-phase equivalent current (01E0H = 480 hundredths of A = 4.8A)
- D9 EB = CRC

2.1 Function 01: “READ OUTPUT STATUS”

This function is used to read the status of the R5 ed R8 output; he output is treated like a coil, following MODBUS standard.

The request and answer frame are described below:

Read request (master):

Addr	Func	Coil Addr Start H	Coil Addr Start L	Number of Coils H	Number of Coils L	CRC	CRC
1Fh	01h	00h	00h	00h	10h	3Eh	78h

In the example above the “read output function” **Func = 01** is sent to the slave with address **Addr = 1Fh**, starting from register **Coil Addr Start = 0000h** (compulsory) for **Number of coils = 10h** (compulsory) adjacent coils. The frame is closed with **CRC=3E78h**.

Reply (slave):

Addr	Func	Byte Count	Data Coil Byte 1H	Data Coil Byte 0H	CRC	CRC
1Fh	01h	02h	00h	00h	11h	FEh

The answer fields, as described above, are the slave address **Addr = 1Fh**, the function executed **Func = 01**, the number of data bytes following **Byte Count = 02h**, the coil value **0000h**.

For R5, bit 0, bit 1, bit 2, bit 3 and bit 4 are respectively associated with relay output 1, relay output 2, relay output 3, relay output 4 and relay output 5.

For R8, bit 0, bit 1, bit 2, bit 3, bit 4, bit 5, bit 6, bit 7, bit 9 and bit 10 are respectively associated with relay output 1, relay output 2, relay output 3, relay output 4, relay output 5, relay output 6, relay output 7, relay output 8, relay output 9, relay output 10 and relay output 11.

This function is used to read the status of the R14 output; the output is treated like a coil, following MODBUS standard.

The request and answer frame are described below:

Read request (master):

Addr	Func	Coil Addr Start H	Coil Addr Start L	Number of Coils H	Number of Coils L	CRC	CRC
1Fh	01h	00h	00h	00h	20h	3Eh	6Ch

In the example above the “read output function” **Func = 01** is sent to the slave with address **Addr = 1Fh**, starting from register **Coil Addr Start = 0000h** (compulsory) for **Number of coils = 20h** (compulsory) adjacent coils. The frame is closed with **CRC=3E6Ch**.

Replay (slave):

Addr	Func	Byte Count	Data Coil Byte 3H	Data Coil Byte 2H	Data Coil Byte 1H	Data Coil Byte 0H	CRC	CRC
1Fh	01h	04h	00h	00h	00h	00h	05h	D0h

The answer fields, as described above, are the slave address **Addr = 1Fh**, the function executed **Func = 01**, the number of data bytes following **Byte Count = 04h**, the coil value **00000000h**.

For R14 models the correspondence bit-coil value is described below:

bit 0	output 1
bit 1	output 2
bit 2	output 3
bit 3	output 4
bit 4	output 5
bit 5	output 6
bit 6	output 7
bit 7	output 8
bit 8	output 9
bit 9	output 10
bit 10	output 11
bit 11	output 12
bit 12	output 13
bit 13	output 14
bit 14	output 15
bit 15	output 16
bit 16	output 17
bit 17	output 18
bit 18	output 19
bit 19	output 20
bit 20	output 21
bit 21	output 22
bit 22	output 23
bit 23	output 24
bit 24	output 25
bit 25	output 26
bit 26	output 27
bit 27	output 28
bit 28	output 29

2.2 Function 03 : “READ HOLDING REGISTERS”

This function reads one or more memory adjacent locations, each one being 1 or 2-word sized. It is possible to read up to 24 consecutive measures.

Below are described the read request format (from master to slave) and the reply format (from slave to master).

Read request (master):

Addr	Func	Data Start Register H	Data Start Register L	Data # of Regs H	Data # Regs L	CRC	CRC
1Fh	03h	00h	11h	00h	08h	17h	B7h

In the example above, the master sends the ‘read function’ **Func = 03** to the slave with address **Addr = 1Fh**, starting from base register address **Data Start Register = 0011h** for **Data Regs = 08h** consecutive registers. So the command reads all registers from address **0011h** to **0018h**. The **CRC = 17B7h** closes the data stream.

(Note: the physical address is always obtained from measure address reduced of 1 unit, see note above).

Replay (slave)

Addr	Func	Byte Count	Data Out Reg 0012 H	Data Out Reg 0012 L	Data Out Reg 0018H	Data Out Reg 0018L	CRC	CRC
1Fh	03h	10h	10h	EFh	3Bh	40h	xxh	yyh

The table above shows the fields in the PFC reply, which are :

- Addressed Slave Addr = 1Fh
- Function code request Func = 03
- Number of data byte following Byte Count = 10h
- Data byte fields requested by the master
- CRC closes the reply data streamLa trama di risposta termina sempre con il CRC.

There are three particular cases that can happen using this command; the first is related to the quantity of requested memory, the second is related to the beginning of the requested segment and the last is related to the quantity of the requested words.

In particular, if the quantity of the requested bytes is greater than the slave's memory extension, the instrument will answer an "INVALID DATA" for the not available values; for example, if are requested 20 bytes from the last fourth valid address, a part of the request overflows in the not available memory. The exceeded bytes will be filled by the slave with the value FFh1, indicating a not managed value for those memory cells.

The second particular case is related to a request starting from a not valid address, when the request starts from an address not present in the following table. In this case the instrument will answer with an exception "02 ILLEGAL DATA ADDRESS" (see chapter 3).

The last particular case is the request of a number of word greater than the maximum for the instrument: in this case the instrument will answer with an exception "02 ILLEGAL DATA address" (see chapter 3).

Memory map

The table in **Annex A** indicates the correspondence between the address of the location, the number of accessible words beginning with that address, the description of the measurement value, the unit of measurement of the measurement value and the binary format.

Formats of the variables passed:

- **Unsigned Long**: means a binary number of 2 words (32 bits) unsigned
- **Bit Signed Long**: means a binary number of 2 words (32 bits) if not, the MSB is set to 1.
For example: 8000 0007h = -7.
- **Signed Int**: means a binary 2's-complement number
- **Unsigned Int**: is a binary number of 1-word (16-bit) unsigned
- **Float**: is a floating point (32-bit)

2.3 Function 06 : “PRESET SINGLE REGISTER”

This function lets the user set the Setup parameters of the instrument. Below are described the write request format (from master to slave) and the reply format (from slave to master).

Write request (master):

Addr	Func	Register H	Register L	Data H	Data L	CRC	CRC
------	------	------------	------------	--------	--------	-----	-----

Example

Addr	Func	Register H	Register L	Data H	Data L	CRC	CRC
1Fh	06h	00h	05h	00h	0Fh	DAh	71h

In this example is set the *Average period*, address 6 (0006h), with the value 15 (000Fh). (Note: the physical address is always obtained from measure address reduced of 1 unit, see note above).

The table in **Annex B** indicates the correspondence between the address of the location, the number words, the description of the measurement value, the minimum and maximum value, the unit of measurement of the measurement value and the binary format.

2.4 Function 16 : “PRESET MULTIPLE REGISTER”

This function is available only for R14 models. It can be used to write only 2 register. Below are described the write request format (from master to slave) and the reply format (from slave to master).

Write request (master):

Addr	Func	Reg. H	Reg. L	N Reg. H	N Reg. L	N bytes	Data 4	Data 3	Data 1	Data 0	CRC	CRC
------	------	--------	--------	----------	----------	---------	--------	--------	--------	--------	-----	-----

Example

Addr	Func	Reg. H	Reg. L	N Reg. H	N Reg. L	N bytes	Data 4	Data 3	Data 1	Data 0	CRC	CRC
1Fh	10h	08h	69h	00h	02h	04h	41h	20h	00h	00h	27h	F3h

In this example is set the *Analog input1 min*, address 2154 (086Ah) and value 10 in floating point format (41200000h).). (Note: the physical address is always obtained from measure address reduced of 1 unit, see note above).

The table below indicates the correspondence between the address of the location, the number words, the description of the measurement value, the minimum and maximum value, the unit of measurement of the measurement value and the binary format.

Addr.	N° Word	Description	Min.	Max.	Format
2154	2	Analog input 1 minimum	-10000,0	10000,0	Float
2156	2	Analog input 1 maximum	-10000,0	10000,0	Float

2.5 Function 17: “REPORT SLAVE ID”

This function makes it possible to read the instrument identifier for R5, R8 and R14 models.

Read request (master):

Addr	Func	CRC	CRC
02h	11h	C0h	DCh

Replay (slave):

Addr	Func	Len	Inst. Type (MSB)	Inst. Type (LSB)	Fw rel. (MSB)	Fw rel. (LSB)	CRC	CRC
02h	11h	04h	01h	55h	00h	33h	9Bh	B8h

The answer contains address and function, the number of data bytes **Len = 04h**, the analyser description **Inst. type = 0155h**, and the firmware version Fw rel. = 0033h (51): this value must be divided by 100 (V0.51). CRC **9BB8h** ends the frame.

Inst. type	PFC controller model
101	R5 485
141	R8 485
145	R8 485 USB
146	R8 485 BT
301	R5 485 RADIO
341	R8 485 RADIO
345	R8 485 USB RADIO
346	R8 485 BT RADIO
801	R14 485
805	R14 485 BT
809	R14 485 29R
817	R14 485 AI

3. Exceptions on the Bus

Below is a table of the exceptions handled for errors regarding access to the bus.

Eccezione	Descrizione
01 ILLEGAL FUNCTION	An unsupported function code has been sent
02 ILLEGAL DATA ADDRESS	Illegal address
03 ILLEGAL DATA VALUE	A setup datum is outside of the acceptable limits

4. CRC algorithm

The CRC used in MODBUS follows the standard CRC-16 defined by CCITT. Many algorithms are ready off-the-shelf, below one is reported, written in C, which uses a look-up table.

```

/*CRC-16 (reverse) table lookup for Modbus CRC-16
*   Project: Modbus
*   Author: Lynn August Linse, based on method used by XMODEM
*16Feb94 LAL Create from book about XMODEM */

(*1) For what concerns PF and Cosphi, please note that:

1. in case of inductive PF or Cosphi quantities are positive; in case of capacitive PF or Cosphi quantities are negative;
2. when PF and Cosphi are not defined (zero current), 200 is the returned value indicating this particular situation (the device screen shows three hypens ""---"").

(*2) Reading the Alarms status, please note that:

the value is to convert in bit-field (1 = ON and 0 = OFF) and the meaning of the bit are shown in the table below.

For R8 and R14:

- Bit0: High voltage alarm status
- Bit1: High current alarm status
- Bit2: Low voltage alarm status
- Bit3: Low current alarm status
- Bit4: THDI% alarm status
- Bit5: THDV% alarm status
- Bit6: Temperature alarm status
- Bit7: Fan alarm status
- Bit8: High cosfi alarm status
- Bit9: Low cosfi alarm status
- Bit10: Voltage dip alarm status

For R5:

- Bit0: High voltage alarm status
- Bit1: High current alarm status
- Bit2: Low voltage alarm status
- Bit3: Low current alarm status
- Bit4: THDI% alarm status
- Bit5: THDV% alarm status
- Bit6: Temperature alarm status
- Bit7: High cosfi alarm status
- Bit8: Low cosfi alarm status
- Bit9: Voltage dip alarm status

(*3) Reading the battery breakage status, please note that:

the value is to convert in bit-field (1 = BROKEN and 0 = OK) and the meaning of the bit are shown in the table below.

- Bit0: C1 step breakage status
- Bit1: C2 step breakage status
- Bit2: C3 step breakage status
- Bit3: C4 step breakage status
- Bit4: C5 step breakage status
- Bit5: C6 step breakage status
- Bit6: C7 step breakage status
- Bit7: C8 step breakage status
- Bit8: C9 step breakage status
- Bit9: C10 step breakage status
- Bit10: C11 step breakage status
- Bit11: C12 step breakage status
- Bit12: C13 step breakage status
- Bit13: C14 step breakage status
- Bit14: C15 step breakage status
- Bit15: C16 step breakage status
- Bit16: C17 step breakage status
- Bit17: C18 step breakage status
- Bit18: C19 step breakage status
- Bit19: C20 step breakage status
- Bit20: C21 step breakage status
- Bit21: C22 step breakage status
- Bit22: C23 step breakage status
- Bit23: C24 step breakage status
- Bit24: C25 step breakage status
- Bit25: C26 step breakage status
- Bit26: C27 step breakage status
- Bit27: C28 step breakage status

Bit28: C29 step breakage status

- (*4) Reading the battery status, please note that:
the value is to convert in bit-field (1 = INSERTED and 0 = NOT INSERTED) and the meaning of the bit are shown in the table below.

According to device model:

Bit0: C1 step status
 Bit1: C2 step status
 Bit2: C3 step status
 Bit3: C4 step status
 Bit4: C5 step status
 Bit5: C6 step status
 Bit6: C7 step status
 Bit7: C8 step status
 Bit8: C9 step status
 Bit9: C10 step status
 Bit10: C11 step status
 Bit11: C12 step status
 Bit12: C13 step status
 Bit13: C14 step status
 Bit14: C15 step status
 Bit15: C16 step status
 Bit16: C17 step status
 Bit17: C18 step status
 Bit18: C19 step status
 Bit19: C20 step status
 Bit20: C21 step status
 Bit21: C22 step status
 Bit22: C23 step status
 Bit23: C24 step status
 Bit24: C25 step status
 Bit25: C26 step status
 Bit26: C27 step status
 Bit27: C28 step status
 Bit28: C29 step status

- (*5) Reading the maximum battery insertion status, please note that the value is to convert in bit-field (1 = EXCEEDED and 0 = OK) and the meaning of the bit are shown below, according to device model:

Bit0: C1 Maximum battery insertions exceeded
 Bit1: C2 Maximum battery insertions exceeded
 Bit2: C3 Maximum battery insertions exceeded
 Bit3: C4 Maximum battery insertions exceeded
 Bit4: C5 Maximum battery insertions exceeded
 Bit5: C6 Maximum battery insertions exceeded
 Bit6: C7 Maximum battery insertions exceeded
 Bit7: C8 Maximum battery insertions exceeded
 Bit8: C9 Maximum battery insertions exceeded
 Bit9: C10 Maximum battery insertions exceeded
 Bit10: C11 Maximum battery insertions exceeded
 Bit11: C12 Maximum battery insertions exceeded
 Bit12: C13 Maximum battery insertions exceeded
 Bit13: C14 Maximum battery insertions exceeded
 Bit14: C15 Maximum battery insertions exceeded
 Bit15: C16 Maximum battery insertions exceeded
 Bit16: C17 Maximum battery insertions exceeded
 Bit17: C18 Maximum battery insertions exceeded
 Bit18: C19 Maximum battery insertions exceeded
 Bit19: C20 Maximum battery insertions exceeded
 Bit20: C21 Maximum battery insertions exceeded
 Bit21: C22 Maximum battery insertions exceeded
 Bit22: C23 Maximum battery insertions exceeded
 Bit23: C24 Maximum battery insertions exceeded
 Bit24: C25 Maximum battery insertions exceeded
 Bit25: C26 Maximum battery insertions exceeded
 Bit26: C27 Maximum battery insertions exceeded
 Bit27: C28 Maximum battery insertions exceeded
 Bit28: C29 Maximum battery insertions exceeded

- (*6) When reading the relay status, please note that the value is to convert in bit-field (1 = CLOSED and 0 = OPEN) and the meaning of the bit are shown in the table below, according to device model:

Bit0: Status of relay 1
 Bit1: Status of relay 2
 Bit2: Status of relay 3
 Bit3: Status of relay 4
 Bit4: Status of relay 5
 Bit5: Status of relay 6
 Bit6: Status of relay 7
 Bit7: Status of relay 8
 Bit8: Status of relay 9
 Bit9: Status of relay 10
 Bit10: Status of relat 11
 Bit11: Status of relat 12
 Bit12: Status of relat 13
 Bit13: Status of relat 14

- Bit14: Status of relat 15
- Bit15: Status of relat 16
- Bit16: Status of relat 17
- Bit17: Status of relat 18
- Bit18: Status of relat 19
- Bit19: Status of relat 20
- Bit20: Status of relat 21
- Bit21: Status of relat 22
- Bit22: Status of relat 23
- Bit23: Status of relat 24
- Bit24: Status of relat 25
- Bit25: Status of relat 26
- Bit26: Status of relat 27
- Bit27: Status of relat 28
- Bit28: Status of relat 29

PRESET SINGLE REGISTER FUNCTION (0x03h)

(*2) For R5 max and min value are 210 and 160000.

(*3) VT secondary max e min for R5 has to possible range (210;250) and (370; 430);

(*4) For R5 the available values are:

0 = Step;
 1 = Always off step;
 2 = Always on step;
 3 = N.O. contact alarm;

For R8 and R14 the available values are:

0 = Step;
 1 = Always off step;
 2 = Always on step;
 3 = N.O. contact alarm;
 4 = N.C. contact alarm;
 5 = FAN output;
 6 = MAN/AUTO output;

(*5) For R8 and R14 the available values are:

0 = High voltage;
 1 = High current;
 2 = Low voltage;
 3 = Low current;
 4 = High THDV%;
 5 = High THDI%;
 6 = High temperature;
 7 = Not used
 8 = High Cosfi ;

9 = Low Cosfi;
10 = Generic;

For R5 the available values are:

0 = High voltage;
1 = High current;
2 = Low voltage;
3 = Low current;
4 = High THDV%;
5 = High THDI%;
6 = High temperature;
7 = High Cosfi;
8 = Low Cosfi;
9 = Generic;

(*6) For R8 and R14 the available values are:

0 = High voltage;
1 = High current;
2 = Low voltage;
3 = Low current;
4 = High THDV%;
5 = High THDI%;
6 = High temperature;
7 = Not used
8 = High Cosfi ;
9 = Low Cosfi;
10 = Generic;

(*7) For R8 and R14 the available values are:

0 = Step;
1 = Always off step;
2 = Always on step;
3 = N.O. contact alarm;
4 = N.C. contact alarm;
5 = FAN output;
6 = MAN/AUTO output;

(*8) For R8 the available values are:

0 = Step;
1 = Always off step;
2 = Always on step;
3 = N.O. contact alarm;
4 = N.C. contact alarm;
5 = FAN output;
6 = MAN/AUTO output;
7 = R8 running (RUN);

For R14 the available values are:

0 = Step;
1 = Always off step;
2 = Always on step;
3 = N.O. contact alarm;
4 = N.C. contact alarm;
5 = FAN output;
6 = MAN/AUTO output;

(*9) For R14 the available values are:

0 = Step;
1 = Always off step;
2 = Always on step;
3 = N.O. contact alarm;
4 = N.C. contact alarm;
5 = FAN output;
6 = MAN/AUTO output;

(*10) For R14 the available values are:

0 = Step;
1 = Always off step;
2 = Always on step;
3 = N.O. contact alarm;
4 = N.C. contact alarm;
5 = FAN output;
6 = MAN/AUTO output;
7 = R14 running (RUN);

(*11) For R5, R8 and R14 the available values are:

1 = 0,7% of CT primary;
2 = 1,0 % of CT primary;
3 = 1,5 % of CT primary;
4 = 2,0 % of CT primary;
5 = 2,5 % of CT primary;
6 = 3,0 % of CT primary;
7 = 3,5 % of CT primary;
8 = 4,0 % of CT primary;
9 = 4,5 % of CT primary;
10 = 5,0 % of CT primary;
11 = 5,5 % of CT primary;
12 = 6,0 % of CT primary;

- 13 = 6,5 % of CT primary;
- 14 = 7,0 % of CT primary;
- 15 = 7,5 % of CT primary;
- 16 = 8,0 % of CT primary;
- 17 = 8,5 % of CT primary;
- 18 = 9,0 % of CT primary;
- 19 = 9,5 % of CT primary;
- 20 = 10,0 % of CT primary;
- 21 = 10,5 % of CT primary;

(*12) For R5, R8 and R14 the available values are:

- 1= 5% of degradation;
- 2= 10% of degradation;
- 3= 15% of degradation;
- 4= 20% of degradation;
- 5= 25% of degradation;
- 6= 30% of degradation;
- 7= 35% of degradation;
- 8= 40% of degradation;
- 9= 45% of degradation;
- 10= 50% of degradation;
- 11= 55% of degradation;
- 12= 60% of degradation;
- 13= 65% of degradation;
- 14= 70% of degradation;
- 15= 75% of degradation;
- 16= 80% of degradation;
- 17= 85% of degradation;
- 18= 90% of degradation;
- 19= 95% of degradation;
- 20= 100% of degradation;

(*13) For R8 must be a valid address of the Read Holding Register map.

For R14 the available values are:

- 0 = DISABLED
- 1 = V 3F RMS
- 2 = I 3F RMS
- 3 = I 3F RMS AVG
- 4 = W 3F
- 5 = W 3F AVG
- 6 = VAr 3F
- 7 = VAr 3F AVG
- 8 = VA 3F
- 9 = VA 3F AVG
- 10 = W 3F DFT
- 11 = W 3F AVG DFT
- 12 = VAr 3F DFT
- 13 = VAr 3F AVG DFT
- 14 = VA 3F DFT
- 15 = VA 3F AVG DFT
- 16 = PF 3F
- 17 = PF 3F AVG
- 18 = COSFI 3F
- 19 = COSFI 3F AVG
- 20 = THDI L1
- 21 = THDV L1
- 22 = FRQ.
- 23 = TEMP.
- 24 = ANALOG 1
- 25 = ANALOG 2

(*14) The list value address must be an address available in the memory map for the READ HOLDING REGISTER.

(*15) The B1, B2, B3 and B4 bands value must be specified using this formula

$$Bn_value = hour * 256 + minute$$

(*16) For R14 the available values are:

- 0 = ENGLISH;
- 1 = ITALIAN;
